Database: swiss-prot37 l:swissprot

Statistics: Mean 45.305; Variance 75.582; scale 0.599

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

INT. IMMUNCL 7:1381-1386(1995).
-!- FUNCTION: CYTOKINE THAT BINDS TO FAS ANTIGEN, A RECEPTOR THAT
TRANSDUCES THE APOPTOTIC SIGNAL INTO CELLS. MAY BE INVOLVED IN
CYTOTOXIC T CELL MEDIATED APOPTOSIS AND IN T CELL DEVELOPMENT.
FAS-ANTIGEN MEDIATED APOPTOSIS MAY HAVE A ROLE IN THE INDUCTION OF
PERIPHERAL TOLERANCE, IN THE ANTIGEN-STIMULATED SUICIDE OF MATURE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "The mouse Fas-ligand gene

-!- FUNCTION: LYMPHOTOXIN IS A CYTOKINE PRODUCED BY LYMPHOCYTES WHICH
IS CYTOTOXIC FOR A WIDE RANGE OF TUMOR CELLS IN VITRO AND IN VIVO.
-!- SUBUNIT: HETEROTRIMER OF EITHER TWO BETA AND ONE ALPHA SUBUNITS
OR (LESS PREVALENT) TWO ALPHA AND ONE BETA SUBUNITS.
-!- SUBCELLULAR LOCATION: SECRETED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LTA OR THEE.

"Cloning and characterization of the tandemly arranged bovine
lymphotoxin and tunour necrosis factor-alpha genes.";
CYTOKINE 5:336-341(1993).

-i- FUNCTION: LYMPHOTOXIN IS A CYTOKINE PRODUCED BY LYMPHOCYTES WHICH
IS CYTOTOXIC FOR A WIDE RANGE OF TUMOR CELLS IN VITRO AND IN VIVO.

-i- SUBUNIT: HETEROTRIMER OF EITHER TWO BETA AND ONE ALPHA SUBUNITS
OR (LESS PREVALENT) TWO ALPHA AND ONE BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                   PROSITE;

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tue Jan 18 13:19:47 2000; MasPar time 9.89 Seconds 704.591 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score:

Sequence: >US-09-246-129-2 (1-174) from US09246129A.pep 1314 1 MRRFLSKVYSFPMRKLILFL......DISLVDYTKEDKTFFGAFLL 174

Scoring table: PAM 150 Gap 11

Searched: 122810 seqs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir60
1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 44.271; Variance 85.869; scale 0.516

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#journal Nucleic Acids Res. (1987) 15:9083-9084

#title Nucleotide sequence of the murine TNF locus, including

TNF-alpha-(tumor necrosis factor) and TNF-beta-
(lymphotoxin) genes.

They are induced by similar mitogenic stimuli and have similar biological activities but are produced by different cell types and have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Secreted from mitogen-activated lymphocytes within 1-2 days after induction, this lymphotoxin can cause cytolysis of certain tumor cell lines and have an antiproliferative effect on others while having no detrimental effect on normal cells. It can also act synergistically with interferon gamma to kill certain transformed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   different induction kinetics.

VIT Secreted from mitogen-activated macrophages within 4-24 hours after
induction, TNF-alpha can cause cytolysis of certain tumor cell
lines and have an antiproliferative effect on others without
detriment to normal cells. It can also act synergistically with
interferon gamma to kill certain transformed cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ##molecule_type protein

                                                                                                                                                              TNF-alpha and -beta (lymphotoxin) are the products of different genes closely linked on chromosome 6. They are induced by similar mitogenic stimuli and have similar biological activities but are produced by different cell types and have different induction

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                Claim 1; Fig 1: 69pp; English.

Human tumour necrosis factor-gamma (R99453) is a novel member of the TNF family. It is encoded by a cDNA clone (T30390) isolated from a human umbilical vein endothelial cell cDNA library.

Recombinant TNF-gamma can be expressed in bacterial, insect or mammalian cells transformed with a vector carrying the TNF-gamma coding sequence. It is used to inhibit tumour cell growth, to provide resistance to infection, to induce inflammatory activity, for wound healing etc., and to screen for (ant)agonists or to

PT Heteromeric complexes comprising lymphotoxin sub-units - useful as prinhibitors of signalling by TNF- and TNF-related receptors, for treating auto:immune disease, graft rejection. etc.

PT treating auto:immune disease, graft rejection. etc.

PS Disclosure; Fig 10; 87pp; English.

CC This sequence comprises the C-terminal extracellular domain of the Fas CC ligand altered to drive trimerisation with wild-type lymphotoxin (LT)-cc beta. LT subunit association domains potentiate subunit associations into an active trimeric ligand. Tumour necrosis factor (TNF)-related ligand CC an active trimeric ligand. Tumour necrosis factor (TNF)-related ligand CC monomers mutated in their respective subunit associations domains can CC form heteromeric complexes with LT subunits. LT-alpha/beta heteromeric CC complexes and LT heterotrimeric complexes are useful as inhibitors of CC signalling by TNF receptors (R) and TNF-related receptors, such as CD40, CC signalling by TNF receptors. By inhibiting TNF-residentling the complexes CC including diabetes, rheumatoid arthritis, inflammatory bowel disease and CC including diabetes, rheumatoid arthritis, inflammatory bowel disease and CC including diabetes, rheumatoid arthritis, inflammatory bowel disease and CC are also useful for preventing or reducing the severity of an immune CC semence 180 AB.

Example; Fig 4; 29pp; English.
The inventors claim new pure lymphotoxin and its derivs. for antitumour use. The variants are esp. lymphotoxin wherein an AA residue in the SQ in P50055 has been (a) deleted, (b) substituted another residue (c) another residue has been inserted into the SQ provided, however, that such variant lymphotoxin excludes having amino terminii at Leu(35) or His(57). Nucleic acids encoding such a such control of the square of the squa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (GETH )

The sequence of murine lymphotoxin (TNF-beta) disclosed
J.Immunology 138:4496-4501 (1987) is given in the specification.
A modified version of this sequence is claimed in which at least
of the channel residues is substituted (see Features Table). The
resulting TNF-beta mutein has modified channel activity compared
wild-type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing modified tumour necrosis factor alpha - uregulating tumour necrosis factor channel activity increasing permeability

                                                                                                                                                                                                                         This sequence represents a novel rat Fas ligand-like protein. This protein can be used as a therapeutic and/or prophylactic agent for cancer, viral infection, Helicobacter pylori infection, invasive staphylococcia, hepatitis, nephritis, bone disease, atherosclerosis or pain. The protein can also be used in a method to treat acquired immune deficiency syndrome (AIDS), joint tissues in rheumatism, inflammation, hepatitis, neurodegenerative disease due to osteomyelodysplasia, ischaemic disease, autoimmune disease, diabette complications, ischaemic disease, autoimmune disease, diabettes, diabettic complications, and cardiomyopathy, influenza, glomerulonephritis or ulcerative colitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rat Fas ligand-like protein.

Fas antigen; ligand-like; apoptosis-inducing activity; therapeutic; prophylactic; cancer; viral infection; hepatitis; nephritis; influenza; bone disease; atherosclerosis; inflammation; neurodegenerative disease; ischaemic disease; autoimmune disease; diabetes; cardiomyopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Physiologically active polypeptide(s) - have defined sequence of 150 amino acid residues and are useful as tumouricides Claim 1; Page 1; 10pp; Japanese. The protein is produced by modification of a TNF expression plasmid. A Met residue is optionally bonded to the N-terminal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (TAKE ) TAKEDA CHEM IND LTD.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding cytokine TNF-related apoptosis ligand polypeptides - useful for producing recombinant polypeptides for research and therapy of leukaemia, lymphoma, melanoma and viral infections Claim 1; Columns 41-44; 28pp; English.

This represents a murine tumour necrosis factor related apoptosis ligand (TRAIL) polypeptide. The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful in studies of Jurkat cells. The encoding nucleic acid sequences are useful in studies of apoptosis, to purify leukaemia, lymphoma or melanoma cells (e.g. to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marrow), or to treat viral infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse tumour necrosis factor related apoptosis inducing ligand (TRAIL) (W19788) is a novel cytokine that induces apoptosis of certain target cells, including cancer cells and virally infected cells. Its amino acid sequence was deduced from CDNA clone MUAIC (T72849), isolated from a T cell line 789 library. Human TRAIL (W19787) has also been identified. Recombinant TRAIL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used the composition of the composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-JUN-1995; US-496632.

Claim 7: Page 33-34; 54pp; English.
Claim 7: Page 33-34; 54pp; English.
The present sequence represents murine AGP-1. AGP-1 is a tumour-necrosis factor (TNF)-related protein, involved in inflammation, myelopoiesis and bone resorption. It has the same nucleic acid and amino acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAIL) described in Immunity, 3 (1995) 673. Antibodies (Ab) are used as immunoassay reagents for detecting AGP-1 expression. Nucleic acid complementary to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation) or bone resorption diseases (e.g. osteoporosis, osteomyelitis, hypercalcaemia, Paget's disease). AGP-1 can be used to creat haematopoietic diseases associated with reduction in the number of bone marrow cells, particularly neutrophils and lymphocytes, e.g. where caused by disease, injury or exposure to myelosuppressive agents. Host cells, transformed with expression vectors containing AGP-1 DNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AGP-1 is used to regulate AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid arthritis, systemic lupus erythematosus, psoriasis, scleroderma, infection-related
                                                                                                                                                                                              Fas ligands or active fragments able to induce apoptosis in cells which express the Fas cell surface antigen are claimed. The proteins are isolated from human, rat and mouse sources. The present
                                                                                                                                                                                                                                                                                            N-PSDB: 099496.

Peptide which binds to Fas antigen, and antibody reactive with it for treatment and diagnosis of viral or auto:immune diseases Claim 10; Page 221-222; 300pp; Japanese.

Fas ligands or active fragments able to induce apoptosis in cells which express the Fas cell surface antigen are claimed. The proteins are isolated from human, rat and mouse sources. The prese sequence represents part of the mouse Fas ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fas ligand; Tumour Necrosis factor family; apoptosis; cell death; Fas cell surface antigen; Fas-L; mouse.

To treatment and diagnosis of viral or auto:immune diseases Claim 11; Page 222-224; 300pp; Japanese.

Fas ligands or active fragments able to induce apoptosis in cel which express the Fas cell surface antigen are claimed. The proteins are isolated from human, rat and mouse sources. The proteins are represents part of the mouse Fas ligand.

This is the amino acid sequence of human TL2 (also known as TRAIL), which has newly been discovered to be a ligand of human tumour necrosis related receptor TR5 (see W76331). This TR5 polypeptide of the invention and TL2 can be used in screening processes for compounds which bind the receptor, or its ligand, and which activate (agonists) or inhibit (antagonists) the receptor or TL2. Treatment of a subject with the need to inhibit TR5 polypeptide activity comprises administering an antagonist to the polypeptide administering a nucleic acid that inhibits the expression of the nucleotide sequence encoding the polypeptide and/or administering a polypeptide that competes with the polypeptide for its ligand, substrate or receptor. The active agents can be used for the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (e.g. inflammatory bowel disease, procession of the active ischemia, autoimmune diseases (e.g. inflammatory bowel disease, attractive ischemia active restrictory disease syndrome restraction.

The mouse sequence contains an open reading frame coding for a 279 amino acid sequence with 5 N-glycoslation sites and a proline-rich region. The deduced mouse amino acid sequence has 91.4% homology with rat Fas-L. Fas ligands are able to induce apoptosis in cells which express the Fas cell surface antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      arthritis; septicaemia; transplant rejection; autoimmune disease; inflammatory bowel disease; graft versus host disease; infection; stroke; ischaemia: acute respiratory disease syndrome; psoriasis; restenosis; brain injury; AIDS; bone disease; cancer;
